

## Experiment 1

**Student Name:** Tejinderpal Singh

**Branch:** CSE

**Semester:** 6th

**Subject Name:** System Design

**UID:** 23BCS80343

**Section/Group:** KRG 3-B

**Date of Performance:** 07/01/2026

**Subject Code:** 23CSH-314

**1. Aim:** To design and analyze a **URL Shortener System** that converts long URLs into short, unique URLs while ensuring high availability, scalability, low latency, and efficient redirection. The system also supports optional custom URLs, expiration dates, and user authentication.

### **2. Objective:**

- To understand functional and non-functional requirements of a large-scale distributed system.
- To design RESTful APIs for URL creation and redirection.
- To identify core entities such as User, Short URL, and Long URL.
- To analyze CAP theorem trade-offs and apply eventual consistency.
- To design high-level and low-level architecture for a scalable URL shortener.
- To study multiple approaches for short URL generation and compare their performance.

### **3. Tools Used:**

- **Python** – Backend logic implementation and URL generation algorithms.
- **Flask** – Lightweight web framework for developing RESTful APIs.
- **Draw.io** – Designing system architecture diagrams (HLD & LLD).

### **4. System Requirements:**

#### **A. Functional Requirements**

- Create a short URL from a given long URL.
- Support optional custom short URLs.
- Support default and user-defined expiration dates.
- Redirect users from short URL to the original long URL.
- Provide REST APIs for URL creation and redirection.
- Support user registration and login using REST APIs.

#### **B. Non-Functional Requirements**

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

- Low latency ( $\leq 200$  ms for URL creation and redirection).
- High scalability (100M daily active users, 1B URLs).
- High availability ( $24 \times 7$ ).
- Uniqueness of short URLs.
- High availability preferred over strict consistency (Eventual Consistency).

## 5. High Level Design (HLD):

The system follows a **Client–Server–Database architecture**:

- Client sends request to generate or access short URL.
- Server processes business logic and generates short URL.
- Database stores mappings of short URL and long URL.
- On redirection, server fetches long URL and redirects the user.

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

## 6. Low Level Design (LLD):

**Approach : Counter-Based**

- Uses auto-increment counter.
- Counter value converted to Base62 for short URL.

Example:

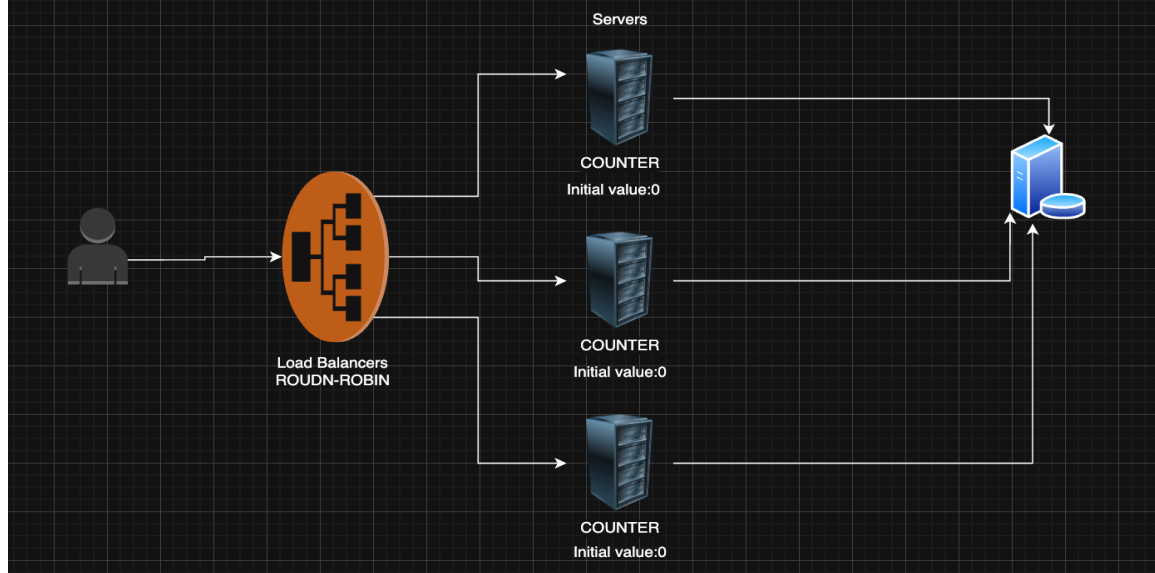

Counter: 10000 → Base62: 2bi → Short URL

- Issue: Single counter causes scalability issues.

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

STEP3:

STEP4:

## 7. Scalability Solution

- Horizontal scaling of application servers.
- Use of Load Balancer (Round Robin).
- Centralized counter stored in Redis cache.
- Redis ensures fast access and atomic increments.
- Database stores final URL mappings.

## **DEPARTMENT OF**

## **COMPUTER SCIENCE & ENGINEERING**

### **8. Learning Outcomes (What I Have Learnt)**

- Learned how to design a real-world scalable system.
- Understood REST API design principles.
- Gained knowledge of CAP theorem and eventual consistency.
- Learned multiple URL shortening techniques and their trade-offs.
- Understood horizontal scaling, caching, and load balancing.
- Learned importance of low latency and high availability systems.
